

yESAO conference Rome 2014

The scientific program of the annual yESAO congress in Rome consisted of eight oral presentations and twelve rapid fire presentations. The topics of the talks addressed a broad spectrum of experimental and computer-based methods, which can be applied to different organs and tissues. Two inspiring presentations were given by patients, talking about how they handle their daily life while being reliant on medical devices (insulin pumps, hip prosthesis).

For the first time, the yESAO congress took place for two days. At the evening of the first day the young researches had the chance to participate on a guided tour through the Baroque Rome, which ended with a typical Italian dinner. At the end of the second day another guided tour was offered, this time through the Ancient Rome. The excellent weather in combination with the beautiful city and the evening events made the yESAO in Rome an unforgettable meeting.
